Détail Etapes

- Fork local
- Fork local → cloner → GitHub
- test api.py sur python

```
sudo apt-get install python-pip
```

· faire les docker file

Docker file api-backend

```
FROM python:3
WORKDIR /usr/src/app
COPY ./api.py .
RUN pip install requests flask
#pip:3 ?
EXPOSE 8001
CMD [ "python", "./api.py" ]
```

```
#Commande docker pour créer l'image
docker image build -t api-backend:v0.1 .
#docker image build -p 8001:8001 api-backend:v0.1 .
```

Docker file api-frontend

```
FROM python:3
WORKDIR /usr/src/app
COPY ./api.py .
RUN pip install requests flask
EXPOSE 8000
CMD [ "python", "./api.py" ]
```

```
#Commande docker pour créer l'image
docker image build -t api-frontend:v0.1 .
```

```
admind@LIN2-deb-docker1:~$ docker image ls
                                                     CREATED
REPOSITORY
                                    IMAGE ID
                           TAG IMAGE ID
v0.1 d183b15d9c68
v0.1 9cc92ee6debb
                           TAG
                                                                       SIZE
api-front
                                                     19 seconds ago
                                                                       932MB
api-backend
                                                     2 minutes ago
                                                                       932MB
python
                           3
                                    9cbe331577ed
                                                                       932MB
                                                     4 days ago
```

```
#Run in container back
docker container run -p 8001:8001 api-backend:v0.1

#Run in container front
docker container run -p 8000:8000 api-frontend:v0.1

#Check : docker container ls -ado
```

```
admind@LIN2-deb-docker1:-$ docker container ls -a

```

• faire le dockercompose

```
Arborescence

./dockerfile
backend frontend

./dockerfile/backend
api.py Dockerfile
./dockerfile/frontend
api.py Dockerfile
```

```
version: '3'
services:
  front:
    build:
      context: ./dockerfile/frontend/
      dockerfile: Dockerfile
    container_name: frontend
   restart: unless-stopped
    environment:
      - API_BACKEND_URL=172.27.160.1
     - API_BACKEND_PORT=8001
    ports:
      - 8000:8000
  back:
    build:
      context: ./dockerfile/backend/
      dockerfile: Dockerfile
    container_name: backend
    restart: unless-stopped
    ports:
     - 8001:8001
    depends_on:
      - "front"
```

pousser les images sur le docker hub (tag)

```
#Launch compose file
docker-compose up -d

#Docker Hub, repository kind of
https://hub.docker.com
login : auggus
PSW : CPNVPa$$w0rd2022

Docker HUB :
docker tag hello:v0.2 auggus/hello:v0.2
```

commit local → github

```
Commit to docker hub

docker tag admind_back:latest auggus/tp-docker-backend:v0.1

docker tag admind_front:latest auggus/tp-docker-frontend:v0.1

docker push auggus/tp-docker-backend:v0.1

docker push auggus/tp-docker-frontend:v0.1
```

Pour lancer le front il faut lui fournir les 2 variables d'environement, IP et Port du back

Request et Flask dépendances, a ajouter dans le docker file
